TITLE: Reactions of hydrazine derivatives. XXXV. A new type of pyrazoline rearrangement, with opening of the ring

PERIODICAL: Zhurnal obshchey khimii, v. 33, no. 1, 1963, 244-247

TEXT: The present paper is a continuation of earlier work (ZhOKh, 32, 651, (1962)), in which 4-ethyl-5-propyl pyrazoline was observed to rearrange into α -ethyl- β -propyl- β -aminopropionitrile, and is aimed at a more detailed study of this new rearrangement. It was found that pyrazolines unsubstituted in position 3, such as 4-ethyl-5-propyl- (I), 4-iso-propyl-5-iso-butyl- (II), and 4,4-dimethyl-5-iso-propyl- (III) pyrazolines, undergo this rearrangement when their hydrochlorides are heated to 210 - 260°C, to the corresponding β -aminonitriles. The reaction is thought to be the result of a redistribution of the electron density, followed by ring opening:

TITLE: Synthesis of heteroannular alkylferrocenylcarbinols

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 10, 1964, 1901-1903

TOPIC TAGS: heteroannular alkylferrocenylcarbinol, synthesis, physical property, Friedel Crafts reaction

ABSTRACT: The heteroannular ethyl-, n-propyl, n-butyl- and benzylferrocenylcarbinols were synthesized according to the following reactions:

Card 1/2

L 24844-65

ACCESSION NR: AP4047405

The methyl ester of ferrocene carboxylic acid was acylated by the Friedel-Crafts reaction, the ketone was reduced with zinc amalgam, and the reduction of 0.004M solutions in ether of the alkylated methyl esters was then effected by heating with 0.002 M suspensions of lithium aluminum hydride in absolute alcohol. The reaction mixtures were separated, the ether solutions were water-washed, and the products were chromatographed on Al_2O_3 . The ethyl and propylferrocene carbinols were vacuum distilled at 10^{-3} mm and the butyl and benzyl derivatives were crystallized from hexane. The boiling points and refractive indices of the final and intermediate products are tabulated. Orig. art. has: 2 tables and 1 equation.

TITLE: Synthesis of certain heteroannular substituted ferrocene carboxylic acids

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 10, 1964, 1903-1905

TOPIC TAGS: ferrocene carboxylic acid, synthesis, cyanoferrocene carboxylic acid, IR spectrum, cyanoferrocene

ABSTRACT: Heteroannular chloro-, bromo-, cyano- and methoxyferrocene carboxylic acids and their methyl esters were synthesized from the corresponding substituted ferrocene carboxylic acid nitriles which had been prepared by cyanation of the ferrocenes in tetrahydrofuran in the presence of FeCl_3 . The heteroannular isomers were crystallized from the reaction mixtures of hetero- and homoannular nitriles, and were identified by their IR spectra. The nitriles of the chloro- and bromoferrocene carboxylic acids were hydrolysed with aqueous alcoholic alkali to their corresponding acids. The methyl ester of 1,1'-cyanoferrocene

TITLE: Transannular electronic effects in the ferrocene nucleus. Dissociation constants of substituted ferrocene carboxylic acids

SOURCE: AN SSSR. Doklady, v. 159, no. 5, 1964, 1075-1078

TOPIC TAGS: ferrocenecarboxylic acid, dissociation constant, substituent effect, induction effect

ABSTRACT: In this work an investigation was made of the transmission of electronic effects in ferrocene using ferrocenecarboxylic acids in which the substituent and the reaction center are located in different rings. The apparent dissociation constants of these acids were measured potentiometrically in 50% ethanol. It was found that the investigated alkyl substituents lower the dissociation constant of ferrocenecarboxylic acid by approximately the same amount while all other substituents increase it. With the exception of halides the majority of substituents have an inductive effect on the dissociation constants of heteroannular ferrocene-

Nuclear magnetic resonance spectra of ferrocene derivatives

SOURCE: AN SSSR. Doklady, v. 160, no. 5, 1965, 1075-1078

TOPIC TAGS: nuclear magnetic resonance, ferrocene, proton resonance, Hammett constant, cyclic compound, cyclopentadienyl metal

ABSTRACT: The authors measured the chemical shifts of proton signals in high-resolution nuclear magnetic resonance spectra of mono- and heteroannular disubstituted ferrocenes, using 10-15% solutions in CCl₄ and an JNM-600 nuclear magnetic resonance spectrometer. In the proton resonance spectra of all disubstituted ferrocenes, a singlet is produced by the five equivalent protons of the unsubstituted five-membered ring, and two triplets are produced by the protons of the substituted ring with a spin-spin interaction constant of 1.5 Hz.

AP5007562

It was found that the chemical shifts of protons of the unsubstituted ring are determined by the induction effect of the substituents. The observed values of the shifts δ_a and δ_b indicate a considerable effect of the conjugation of the substituent on the chemical shifts of protons of the substituted ring. Correspondence is presented between the values of δ_a and δ_b and the conjugation constants ρ_a and ρ_b . The chemical shifts δ_a and δ_b are related to the values of the induction constants σ_a and σ_b of the substituents. The results of the study make it possible to draw a close analogy between the magnitude and character of the induction of the substituents on the (a), (b), and (c) hydrogen atoms of the ferrocene, and correspondingly on the meta, ortho, and para hydrogen atoms of benzene. Fig. 417 has 3 figures, 2 tables, and 1 appendix.

TITLE: Electronic influence of ferrocenyl as a substituent

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 5, 1966, 832-839

TOPIC TAGS: ferrocene, dissociation constant, aniline, benzoic acid, phenol, substi-
tuent, amine

ABSTRACT: By determining values of Hammett's σ , the authors studied certain elec-
tronic effects of ferrocenyl as a substituent. Using acid-base potentiometric titra-
tion, they determined the dissociation constants of p-, m-, and o-ferrocenylbenzoic
acids, a series of substituted benzoic acids and ferrocenecarboxylic acid in 70% di-
oxane, and the dissociation constants of p-ferrocenylphenol and a series of p-substi-
tuted phenols in 50% ethanol. The basicity constants of p-, m-, and o-ferrocenylanil-
ines, a series of p-substituted anilines, and ferrocenylamine in 80% ethanol were
also determined. The data obtained were treated by the least-squares method, ρ val-
ues were calculated for the reaction series studied, σ values were found for ferro-

cenyl as a substituent in various positions of the phenyl ring, and the induction constant σ_1 was determined. The data showed that in the series of ferrocenylbenzoic acids, the strongest is o-ferrocenylbenzoic acid; p- and m-ferrocenylbenzoic acids are comparable in strength and are respectively 1.5 and 1.6 times stronger than ferrocenecarboxylic acid, which therefore is the weakest acid. p-Ferrocenylphenol is a weaker acid than phenol (by a factor of 1.3). The opposite relationship is observed in ferrocenyl derivatives of aniline: o-ferrocenylaniline is the weakest base, 300 times weaker than ferrocenylamine. The strongest base, ferrocenylamine, is 42 times stronger than aniline and almost 28 times stronger than p-ferrocenylaniline. It is concluded that ferrocenyl has a strong positive inductive effect and a weak positive conjugation effect. Orig. art. has: 7 tables and 2 formulas.

Title : Age Changes in the Muscles Acting on the Joint of the first Phalanx of the Toe in Horses.

Orig Pub: Dokl. Mosk. s.-kh. akad. in. K.A. Timiryazeva, 1957, vyp. 27, 284-291.

Abstract: It was shown in 3 embryos (foeti) of 9-10 months, in six three-day old colts and on seven horses from 5 to 21 years of age, that in the process of development the relative weight of the flexor digitorum profundus and of the interosseous third muscle increases, while the relative weight of the flexor

Abs Jour: Ref Zhur-Biol., No 20, 1958, 92520.

digitorum sublimis and of the flexor digitorum lateralis decreases. The latter muscle was better developed in the polydactyl ancestors of horses. All digital muscles grow slower than the other elements of the thoracic extremity. The relative weight of the digital muscle venters increases with age, with the exception of the flexor digitorum lateralis. The relative length of the venter of almost all digital muscles in a new-born colt is smaller than in the fetus. This means that the tendons grow intensively during embryogenesis, and that the venter musculorum grows intensively during the post-natal period. With increased age, the static character develops in muscles which control the digital joints and the ulnar joint when walking,

"The Mechanism of Action of Adrenal Steroids in the Prevention and Therapy of Shock. The Effect of Prednisolone in Noradrenalin and Adrenalin Shock."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 86-89.

Abstract: [Authors' Hungarian summary] In the irreversible shock produced by noradrenalin infusion in dogs, 0.5 mg/kg phenoxybenzamine has a definitely protective effect. Half of the animals survive the shock. Large doses of prednisolone have neither a therapeutic nor a protective effect on noradrenalin or adrenalin shock; they rather decrease the survival rate of the animals by about half and they also increase the pressor and hemoconcentration-increasing effect of noradrenalin. It appears unlikely that the protective or therapeutic effect of corticosteroids, as reported, on shock would be based on the blockage of the adrenergic endapparatus. 3 Hungarian, 4 Western references. AUTHORS: Shvarts, D. M., Granfel'd, A. I. SOV/32-25-8-15/44

TITLE: Chemical-spectrum Analysis Method for the Determination of Cobalt, Tin, and Zinc in Nickel of a Higher Degree of Purity

PERIODICAL: Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 946 - 948 (USSR)

ABSTRACT: The determination of impurities (I) in the purest nickel-metal types is made by spectroscopy according to GOST 6012-57 with a sensitivity (S) of $1 - 3 \cdot 10^{-4}\%$ (Refs 1,2). This sensitivity is inadequate in the testing of metals for certain purposes and it should be at least $1 \cdot 10^{-5}\%$. This scope can be achieved by a previous enrichment of the (I). The method mentioned in the title was developed according to V. P. Zhivopist'ev's statement (Refs 6,7) that diantipyryl methane forms difficultly soluble complex compounds in acid media in the presence of rhodanides with elements like Co, Zn, Sn, Cu, Bi, etc. As nickel does not react with diantipyryl methane nickel can be used for the (I) mentioned in the title as a collector and the final analysis can be conducted according to the standard method GOST 6012-57. The article contains descriptions of the procedure of enrichment

Card 1/2

Chemical-spectrum Analysis Method for the Determina-
tion of Cobalt, Tin, and Zinc in Nickel of a Higher
Degree of Purity

SOV/32-25-8-15/44

of the (I) and the subsequent analysis. The completeness of the extraction of the (I) at the enrichment was tested on standard samples of Ni (Table 1) and the analysis results were compared on Ni-samples according to the described enrichment method and the direct method (Table 2). The sensitivity of the method described is $5 \cdot 10^{-6}$ - $1 \cdot 10^{-5}\%$ for the mentioned (I). There are 2 tables and 8 Soviet references.
